Misc. Network Note # 13

MEMORANDUM TO NETWORK SITES THROUGH NIC

DATE: March 11, 1971

Computer Corporation of America is studying data handling in the ARPA Network and plans to:

1) Design a network data language for uniform and convenient access to remotely located data.

2) Implement the language and an extensive set of data management services on a dedicated data computer. The data computer will have disk storage and a slower, trillion bit direct-access store. The data computer will interface to the network through an IMP.

On-line services will be available early in the project, with the idea of getting experience and improving them. The special-purpose data management software and large capacity store should offer an attractive alternative to storage at network sites, particularly for shared data.

If you have applications, either currently running or planned, that you can imagine moving to the data computer, please let us know about them. We are in the early design stages and can make good use of any information that will give us a feel for potential user requirements. Mailing address and telephone number are:
